### SECTION 3.1

### PROBLEM 10

Prove that if  $\lim(x_n) = 0$  and if x > 0, then there exists a natural number M such that  $x_n > 0$  for all  $n \ge M$ .

PROOF. By the definition of limit, for each positive  $\epsilon$  such an  $M(\epsilon)$  can be found. Thus, take  $\epsilon$  to be smaller than x, so that  $x_n \in V_{\epsilon}(x) = (x - \epsilon, x + \epsilon)$  whenever  $n \ge M$ . Since  $\epsilon < x$ ,  $x - \epsilon \in \mathbb{P}$  so  $x_n > 0$ .

#### PROBLEM 14

Let  $b \in \mathbb{R}$  satisfy 0 < b < 1. Show that  $\lim(nb^n) = 0$ .

PROOF. We first begin by proving the following Lemma: If  $(k_n)^2 \to 0$  and  $k_n < 0$ , then  $k_n \to 0$ .

By hypothesis, given an  $\epsilon > 0$ , there exists some  $M(\epsilon) \in \mathbb{N}$  such that  $|(k_n)^2 - 0| < \epsilon$  whenever  $n \ge M(\epsilon)$ . Further,  $|(k_n)^2 - 0| = ||k_n| \cdot |k_n|| = |k_n|^2$  so that we have  $|k_n| < \sqrt{\epsilon}$ . Since the absolute value of  $k_n$  is smaller than any arbitrary positive number, and we know that  $k_n < 0$  for all choices of n, we have that  $k_n \to 0$ .

Now we may proceed with the main portion of our argument. Since  $b \in (0,1)$ , we may define a sequence  $(k_n)$  such that  $b^{1/n} = 1 + k_n$  for some  $k_n < 0$ . This implies that  $b = (1 + k_n)^n$ .

The Binomial Theorem tells us that  $b = 1 + nk_n + \frac{1}{2}n(n-1)(k_n)^2 + \cdots \ge 1 + \frac{1}{2}n(n-1)(k_n)^2$ , so we have that  $b - 1 \ge \frac{1}{2}n(n-1)(k_n)^2$ . Thus,  $\frac{2b-2}{n(n-1)} \ge (k_n)^2$ .

We know from previous work that  $\frac{1}{n(n-1)} \to 0$ , and since  $\frac{2b-2}{n(n-1)}$  is a constant times a convergent expression, we know that its limit is zero as well. Since  $(k_n)^2$  is bounded above by a sequence which converges to zero, and below by the constant sequence (0), we have that  $(k_n)^2 \to 0$ . Thus, by our earlier Lemma,  $k_n$ 

PROBLEM 17

HINT

If  $n \ge 3$ , then  $0 < 2^n / n! \le 2(\frac{2}{3})^{n-2}$ .

PROOF.

MAIN PROBLEM

Show that  $\lim_{n \to \infty} (2^n/n!) = 0$ .

PROOF.

#### PROBLEM 18

If  $\lim(x_n) = x > 0$ , show that there exists a natural number K such that if  $n \ge K$ , then  $\frac{1}{2}x < x_n < 2x$ .

PROOF.
